6.3: Working with Normally Distributed Variables

<u>Recall</u>: The *z*-score of a data point is its distance from the mean, measured in standard deviations.

Standardizing the values of a normal distribution:

In a normal distribution with mean μ and standard deviation σ , where *x* is a data value, the *z*-score is

$$z = \frac{x - \mu}{\sigma}.$$

The area under a normal curve between x = a and x = b is the same as the area under the standard normal curve between the *z*-score for *a* and the *z*-score for *b*.

Properties of Normal Probability Distributions:

1. $P(a \le x \le b)$ = area under the curve from *a* to *b*.

2. $P(-\infty \le x \le \infty) = 1 = \text{total area under the curve.}$

3. P(x=c)=0.

a

Note: $P(a \le x \le b) = P(a \le x < b) = P(a < x \le b) = P(a < x < b)$

Example 2: Dusty Dog Food Company ships dog food to its distributors in bags whose weights are normally distributed with a mean weight of 50 pounds and standard deviation 0.5 pound. If a bag of dog food is selected at random from a shipment, what is the probability that it weighs h = 50

c) Between 49 and 51 lbs:
c) Between 49 and 51 lbs:
From Part (a), A1 = 0.4772

$$P(49 (X (51)) = 2(0.4772))$$

 $= 0.9544$

Example 3: The medical records of infants delivered at a certain hospital show that the infants' birth weights in pounds are normally distributed with a mean of 7.4 and a standard deviation of 1.2.

- a) What percentage of infants at this hospital weighed more than 9.2 pounds at birth?
- b) What percentage of infants at this hospital weighed less than 8 pounds at birth?
- c) What percentage of infants at this hospital weighed between 8 and 10 pounds at birth?

<u>Important</u>: The *z*-score is the number of standard deviations between the data point and the mean.

Example 4: A variable is normally distributed with mean 83 and standard deviation 24.

- a) Find and interpret the quartiles.b) Find and interpret the 98th percentile.
- c) Find and interpret the first and second deciles.
- d) Find the value that 72% of all possible values of the variable exceed.
- e) Find two values of the variable that divide the area into a middle area of 0.90 and two outside areas of 0.05 each.

6.3.5

Example 5: The GPA of the senior class of a certain high school is normally distributed with a mean of 2.7 and a standard deviation of 0.4 point. If a senior in the top 10% of his or her class is eligible for admission to any state university, what is the minimum GPA that a senior should have to ensure eligibility to a state university?
