

## 5.1: Discrete Random Variables and Probability Distributions

A *random variable* is a quantitative variable that represents the outcomes of a probability experiment. Thus, the value of a random variable depends on chance.

A *discrete random variable* is a random variable that takes on a finite or countably infinite number of values.

A *continuous random variable* is a random variable that takes on all values on an interval of the real number line (i.e., it is not countable).

A *discrete probability distribution* is a function that assigns a probability to each outcome. (So, it assigns a probability to each value of the discrete random variable). If there are a finite number of outcomes, the sum of all their probabilities must equal 1. Each probability must be between 0 and 1, inclusive. The probability distribution can be described by a table, graph, or mathematical formula.

### **Notation:**

If  $X$  is a random variable, then the probability of  $X$  taking on the value  $x$  is denoted  $P(X = x)$ . For example, the probability of  $X$  taking on the value 3 is  $P(X = 3)$ . The probability of  $X$  taking on a values of at least 5 is denoted  $P(X \geq 5)$ .

**Example 1:** A probability distribution is given by the table below.

$x$	12	13	14	15	16	17	18
$P(X = x)$	0.32	0.18	0.13	0.11	0.10	0.08	0.08

note: Sum = 1

a) What is  $P(x=17)$ ?

$$P(X=17) = 0.08$$

b) What is  $P(x \geq 16)$ ?

$$P(X \geq 16) = 0.10 + 0.08 + 0.08 = 0.26$$

c) What is  $P(x > 13)$ ?

$$P(X > 13) = 0.13 + 0.11 + 0.10 + 0.08 + 0.08 = 0.5$$

or use complement)

**Example 2:** A car repair shop's records show that 25 clients have 6 cars, 83 clients have 5 cars, 140 clients have 4 cars, 183 clients have 3 cars, and 209 clients have 2 cars. The remaining 313 clients own only 1 car. Determine the probability distribution for the number of cars owned by the shop's clients. Construct a probability histogram. If the manager decides to randomly call a customer and invite him or her to complete a satisfaction survey, what is the probability that the customer called has 2 or fewer cars?

Let  $X = \#$  of cars owned by customer

$X$	6	5	4	3	2	1	Total
Freq	25	83	140	183	209	313	$n = 953$
$P(X=x)$	$\frac{25}{953}$ $\approx 0.026$	$\frac{83}{953}$ $0.087$	$\frac{140}{953}$ $0.147$	$\frac{183}{953}$ $0.192$	$\frac{209}{953}$ $0.219$	$\frac{313}{953}$ $0.328$	$\approx 1$ $0.999$

$$P(X \leq 2) = 0.219 + 0.328 = \boxed{0.547}$$

**Example 3:** Create a probability distribution to represent the number of girls in a three-child family. Assume that boys and girls are equally likely. Construct the probability histogram. What is the probability that a three-child family has exactly one girl? What is the probability that a three-child family has at least one girl?

Let  $X$  = the number of girls

$S = \{ggg, bgg, gbg, ggb, gbb, bgb, bbg, bbb\}$   
all these are equally likely.

$x$	0	1	2	3
$P(X=x)$	$\frac{1}{8}$	$\frac{3}{8}$	$\frac{3}{8}$	$\frac{1}{8}$

check: Sum = 1 ✓

$$P(X=1) = \boxed{\frac{3}{8}}$$

$$P(X \geq 1) =$$

$$\frac{3}{8} + \frac{3}{8} + \frac{1}{8}$$

$$= \boxed{\frac{7}{8}}$$
