# Solution by Substitutions

### First Order Homogeneous Equations

The first order equation

$$\frac{dy}{dx} = f(x, y)$$

is homogeneous if f(x, y) can be expressed as a function of the ratio y/x alone. Method for solving first order homogeneous equations:

- 1. Transform the equation to the form  $\frac{dy}{dx} = f(x, y)$  if it is not in that form.
- 2. Make the substitution  $u = \frac{y}{x}$ . Then y = ux. Hence,  $\frac{dy}{dx} = u + x\frac{du}{dx}$ .
- 3. Substitute the expression for  $\frac{dy}{dx}$  into the original equation. We will obtain the equation

$$u + x\frac{du}{dx} = G(u)$$

(Note that we have transform the right hand side into a function of  $u = \frac{y}{x}$ . This can be done because of the "homogeneous" assumption.)

4. The above equation is separable because it can be rewritten as

$$\frac{1}{G(u) - u}du = \frac{1}{x}dx.$$

- 5. Integrate both sides to obtain an implicit solution.
- 6. Express the solution in terms of the original variables x and y.

## Example 1: Solve a homogeneous differential equation

#### **Bernoulli Equation**

The first order differential equation

$$\frac{dy}{dx} + P(x)y = Q(x)y^n,$$

where n is any real number is called **Bernoulli's equation**. Note that if n = 0 or n = 1, the equation is linear. On the other hand, for  $n \neq 0, 1$ , this equation is nonlinear. The technique for solving a Bernoulli's equation when  $n \neq 0, 1$  is as follows:

### Method for solving a nonlinear Bernoulli's equation:

1. Divide both sides of the equation by  $y^n$ , we obtain

$$y^{-n}\frac{dy}{dx} + P(x)y^{1-n} = Q(x).$$

2. Let  $u = y^{1-n}$ . By the chain rule, we have

$$\frac{du}{dx} = (1-n)y^{-n}\frac{dy}{dx}.$$

3. The equation in Step 1 then becomes

$$\frac{1}{1-n}\frac{du}{dx} + P(x)u = Q(x).$$

4. Since  $\frac{1}{1-n}$  is a constant, the above equation is a first order linear equation. Hence, it can be solved using the technique in Lecture 4.
